```
human and murine serine protease ztrypl. This is a tryptse like protein which is highly expressed in contractile tissues. The sequences can be used in the treatment and identification of treatments for cardiovascular disease, inflammation, infertility, male reproductive dysfunction, asthma, stroke, immune disorders and gastrointestinal disorders. In addition, they can be used to modulate testicular function and as
                                        provides the protein and coding sequences of the

The present sequence represents the nucleotide sequence of murine HELA2. Human HELA2 was isolated from HeLa cells. HELA2 has high homology to serine proteases. The protein is involved in or associated with requilation of cell activity and/or viability. Administration of requilation of tell activity and/or viability. Administration of recombinant HELA2 (also called testisin) is used to increase fertility. Downrequilation of HELA2 reduces fertility. HELA2 is also a suppressor of testicular germ cell cancers (seminoma) and is also expressed in some non-testicular cancers (of colon, pancreas, prostate and ovary), so is a marker/potential therapeutic target for cancer. The promoter from the testic gene therapy or modulation of fertility. Drugs that block activity of HELA2 should have antitumour activity (other than in testis special cancers); and normalise sperm development (eliminating the need for orchidectomy). Identification of mutant forms of HELA2 can be used to diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               138 ctttgaccacaactttatctatggaggttccctcgtcagtgagaggttgatactgacagc 197

                                                                                                                                                                                                                                                      also a suppressor of testicular germ cell cancers (seminoma) and its also expressed in some non-testicular germ cell cancers (seminoma) and its also expressed in some non-testicular cancers (of colon, pancreas, prostate promoter from the HELA2 gene is useful tor testis-specific expression of other genes, e.g. for gene therapy or modulation of fertility. Drugs that block activity of HELA2 should have antitumour activity (other than in testis recombinant HELA2 should stop growth of tumours and normalise sperm development (eliminating the need for orchidectomy). Identification of mutant forms of HELA2 can be used to
                                                                           isoform of HELA2. CDNA generated from HeLA cells and PAL-2 expressing HeLA cells was amplified using PCR primers AAV48312-13. Three new sequences were detected in the 480 bp amplicon. These sequences are designated HELA2 and ATC2 which have high homology to serine proteases and BCOM3 which has homology to a kinase. The proteins are involved in or associated with regulation of cell activity and/or viability. Administration of recombinant HELA2 (also called testisin) is used to increase fertility. Downregulation of HELA2 reduces fertility. HELA2 is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        507
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        652

```
The present sequence represents a human prostate specific gene (PSG) (gene ID 236019). The mRNA levels for PSG are about 20 fold higher in the prostate than in other tissues. The PSG mRNA was found to be overexprressed in prostate tumour samples. The specification describes a method for diagnosing the presence of, or metastatic potential of, prostate cancer in a patient. The method comprises measuring PSG levels in a cell, tissue or bodily fluid sample of the patient and a control (i.e. a normal human without cancer), where increased PSG levels in the patient compared to the control is associated with the presence of, or metastasis of prostate cancer. The method can also be used for staging prostate cancer in a patient. The methods are used to detect, monitor, stage and give a prognosis for prostate cancer.
                                                                                                                                                                                                                                                                                                Human; prostate specific gene; PSG; prostate tumour; prostate cancer; metastasis; prostate; ss.

                                                                                                                                                                                                                                                                                                    Secretory proteins play important roles in the proliferation control, the differentiation induction, the material transport and the biophylaxis of cells. Membrane proteins have important roles as signal receptors, ion channels and transporters. The present sequence is the coding sequence for a human protein which has at least one hydrophobic domain. The protein encoded by the present sequence may be a secretory or a membrane protein. The encoded protein may have cytokine and cell proliferation/differentiation activity, immune stimulating or suppressing activity, haematopoiesis activity, tissue growth activity, activity, chemotratic/chemokinetic activity, haemostatic and thrombolytic activity, anti-inflammatory activity and tumour inhibition activity. The present sequence could therefore be used for treatment of autoimmune disease, Alzheimer's disease, Parkinson's
                                                                                                                                                                            Proteins comprising hydrophobic regions, such as secretory and membrane proteins, useful in research and diagnostics and having various activities e.g. immunomodulatory, antiinflammatory, chemokinetic, hemostatic, thrombolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    447

HUPM-3 CDNA was initially identified in Incyte clone 789927 from the prostate tumour cDNA library PROSTUT03 using a computer search for amino acid sequence alignments. The present sequence is a consensus sequence alignments. The coverlapping and/or extended nucleic acid sequences: Incyte Clones 789927, 1646976 (PROSTUT09) and 1979791 (LUNGTUT03). A fragment comprising nuclectides 271-330 of the present sequence can be used for hybridisation. Northern analysis shows expression of this

                                                                                                                                                                                                                                        Gaps
           cona libraries. Approximately 86% of these libraries are associated with neoplastic disorders. The invention provides 12 new human proteases, i.e. HUPM-1 to -12 (see AAY0643-43), and the polynucleotides encoding them (see AAX87149-66). Also provided are vectors, host cells and methods for producing HUPM polypeptides, as well as agonists and antagonists of HUPM. Methods for treating orp preventing cell proliferative disorders and immune disorders using HUPM or HUPM antagonists are claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                  agtgagaggttgatactgacagcacactgcatacaaccgacctggactacttttca

                                                                                                                                                                                                                                                                                                                                                                                         The present sequence encodes a human cancer-specific gene (CSG), designated Pro104. The inventive methods comprise measuring expression of CSG in order to diagnose, stage, image and treat gynecologic and nesticular cancers. The levels of CSG are compared to levels found in a normal human control (a change in the measured level of CSG is associated with the presence of the cancer). The early diagnosis of cancers improves the success rate of therapeutic protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  atcctgcctatttgcttgcccagtgtcacaaagcagttggcaattccacccttttgttgg 447

Secretory proteins play important roles in the proliferation control, the differentiation induction, the material transport and the biophylaxis of cells. Membrane proteins have important roles as signal receptors, ion channels and transporters. The present sequence is the coding sequence for a human protein which has at least one hydrophobic domain. The protein encoded by the present sequence may be a secretory or a membrane protein. The encoded protein may have, you've and cell proliferation/differentiation activity, immune stimulating or suppressing activity, haematopoiesis activity, tissue growth activity, and cultimulating activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, anti-inflammatory activity and tumour inhibition activity. The present sequence could therefore be used for treatment of autoimmune disease, Alzheimer's disease, Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    548
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             608

The present sequence represents the nucleotide sequence of the short isoform of HELA2. CDNA generated from HeLa cells and PAI-2 expressing HeLa cells was amplified using PCR primers AAV48312-13. Three new sequences were detected in the 480 bp amplicon. These sequences are designated HELA2 and ATC2 which have high homology to serine proteases and BCOM3 which has bomology to a kinase. The proteins are involved in or associated with regulation of cell activity and/or viability. Administration of recombinant HELA2 (also called testisin) is used to increase fertility. Downregulation of HELA2 reduces fertility. HELA2 is also a suppressor of testicular germ cell cancers (seminoma) and is also expressed in some non-testicular germ cell cancers (seminoma) and is also cancer from the HELA2 gene is useful for testis-specific expression of other genes, e.g. for gene therapy or modulation of fertility. Drugs that block activity of HELA2 should have antitumour activity (other than in testis) while in testis recombinant HELA2 should stop growth of tumours and normalise sperm development (eliminating the need for orchidectomy). Identification of mutant forms of HELA2 can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present sequence encodes protease T protein. The protein is useful for treating a condition mediated by protease T. It is useful for treating an imbalance of desquamation, by topical application of a pharmaceutical composition containing the protease. The composition is useful as a topical skin care composition. It is useful as a laundry detergent, shampoo, hard surface cleaning composition, and dish care cleaning composition. Protease T protein is useful for treating and preventing skin flaking. It is less immunogenic to sensitive individuals and it provides efficient proteolytic activity in a non-natural

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AA252410-252474 are human transcriptional regulator molecule (HTRM)

nuclectide sequences. The HTRM protein and nuclectide sequences are

useful for preventing or treating disorders associated with decreased

expression or activity of HTRM which include cell proliferative

disorders such as arteriosclerosis and cirrhosis; cancers including

adenocarcinoma and leukaemia; immune disorders such as AIDS, Addison's

clasease, diabetes mellitus, rheumatoid arthritis, multiple sclerosis,

cs systemic lupus erythematosus, and myssthenia gravis; infections and

trauma. Antagonists of the HTRM polypeptides are useful for treating or

creaming disorders associated with increased expression or activity of

CHTRMS. HTRM polypeptides, their immunogenic fragments or oligopeptides

are useful for screening libraries of compounds in drug screening

crechniques. Polynucleotides encoding HTRM are useful for blocking the

transcription of mRNA and regulating gene function by modulating the

crechniques. Polynucleotides encoding HTRM or agonists can also be used to

prevent or treat disorder associated with decreased HTRM expression.

Nucleotide sequences encoding HTRM may be useful to generate hybridization probes useful in mapping the naturally occurring genomic sequence and to detect differences in gene sequences among normal, carrier and affected individuals. Using diagnostic assays, cancer can detected prior to the appearance of clinical symptoms and thereby progression of cancer can be prevented by aggressive treatment or

AAX52213-74 encode secreted and transmembrane human proteins, and are obtained from cDNA libraries, prepared from fetal lung, fetal kidney, fetal brain, fetal liver and fetal retina. The encoded polypeptides fetal brain, fetal liver and fetal retina. The encoded polypeptides.

Conservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions (e.g. enterocollitis, collinger-Ellison syndrome, gastrointestinal ulceration and congenital microvilus atrophy), skin diseases associated with abnormal microvilus atrophy), skin diseases associated with abnormal microvilus atrophy), skin diseases associated with abnormal collinger-Ellison syndrome, gastrointestinal ulceration and congenital microvilus atrophy), skin diseases associated with abnormal colling squamous cell carcinoma of the vulva and gliomas), potent effects on cancer. PROSÉS can be used as for fibromodulin, e.g. for nerve cells including Parkinson's disease, Alzheimer's disease, Alzheimer's disease, Alzheimer and growth or survival of cell growth and development, diseases related to growth or survival of cell growth and development, disease, Alzheimer's disease, Alzheimer and growth or survival of cell growth and development, diseases Alzheimer's disease, Alzheimer and protein drugs. PROS63 can be used as a target for anti-tumor drugs. PROS33 may be used in the treatment of Usher Syndrome or Atrophia careata: PROS69 can be used as an anti-thrombotic agent; PROS99 can be used as an anti-thrombotic agent; PROS99 can be used as an anti-thrombotic agent; PROS90 can be used as an anti-thrombotic agent; PROS90 can be used as an anti-thrombotic applications in wound the hourt of contrading and tissue repair; PROS17 can be used for treating problems of the kideney, utertain the treates endometrium, blood vessels, or related tissue, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4

The present sequence is one of sixty one nucleic acids encoding novel secreted and transmembrane PRO polypeptides. The PRO polypeptides are useful for treating skin diseases (e.g. psoriasis), cancers (e.g. lung squamous cell carcinoma), gastrointestinal disorders (e.g. lung enterocolitis), neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease), wound repair, cardiovascular disorders (e.g. endometrial bleeding angiogenesis, ischaemias such as coronary ischaemia, atherosclerosis), inflammatory disorders (e.g. asthma, rhemmatchial placeders such as retinity AIDS and diabetes and retinal disorders such as retinitis pigmentosum.

The PRO nucleic acids have applications in molecular biology, including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     gatacaacggcagacrtcgccttgttgaaactgtcctctcaagtcaccttcacttctgcc 387

* NOTE: This is a 'working draft' sequence. It currently consists of 32 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the apps are unknown. This record will be updated with the flinished sequence as soon as it is available and the accession number will be preserved.
Sequencing vector: M13: 100%
Sequencing vector: plasmid; 0%
Chemistry: Dye-primer ET; 100% of reads
Chemistry: Dye-terminator B19 by of reads
Chemistry: Dye-terminator B19 by of ceads
Assembly program: Phrap; version 0.990319
Consensus quality: 160877 bases at least Q40
Consensus quality: 160979 bases at least Q30
Consensus quality: 169458 bases at least Q20
Insert size: 188000; agarose-fp

It currently consists of 30 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Center clone name: 731_D_1

Sequencing vector: M13, M77815; 100% of reads
Sequencing vector: M13, M77815; 100% of reads
Chemistry: Dye-terminator B19 Dye; 100% of reads
Assembly program: Phrap; version 0.960731
Consensus quality: 189918 bases at least Q40
Consensus quality: 117856 bases at least Q30
Consensus quality: 174264 bases at least Q20
Insert size: 182000; agarose-fp
Insert size: 177255; sum-of-contigs
Quality coverage: 3.7 in Q20 bases; sum-of-contigs
Quality coverage: 3.8 in Q20 bases; sum-of-contigs

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            * NOTE: This is a 'working draft' sequence. It currently consists of 32 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                             Sequencing vector: M13; 100%

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NOTE: This is a 'working draft' sequence. It currently consists of 30 contigs. The true order of the pieces is not known and their order in this sequence record is
